

LangGraph Eco-System

Wednesday, July 29, 2026 7:55 PM

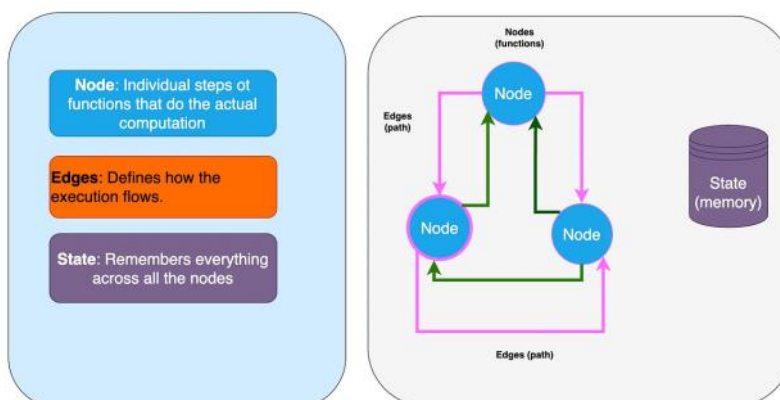

1. LangChain - Components (Prompt, LLM, Embedding, Data Loader, Chaining, LCEL etc.)
2. LangSmith - Logging info and monitoring the logs
3. LangServer - Cloud serving provider
4. LangGraph - Provide graph structure formats like Node, Edge, and Workflow

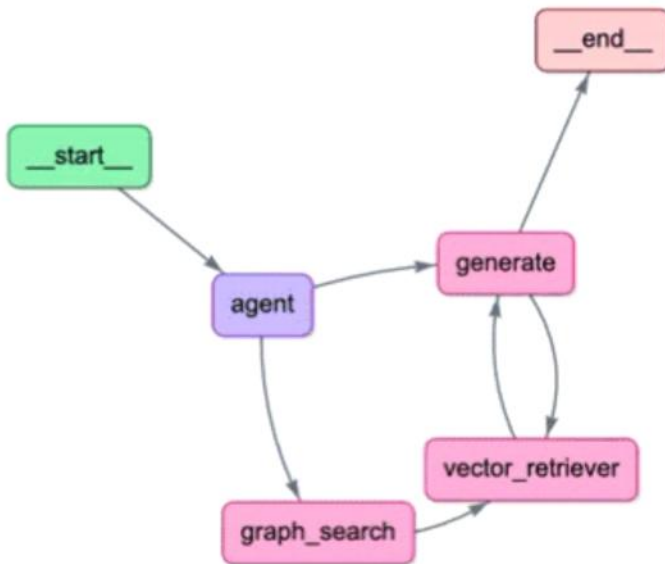

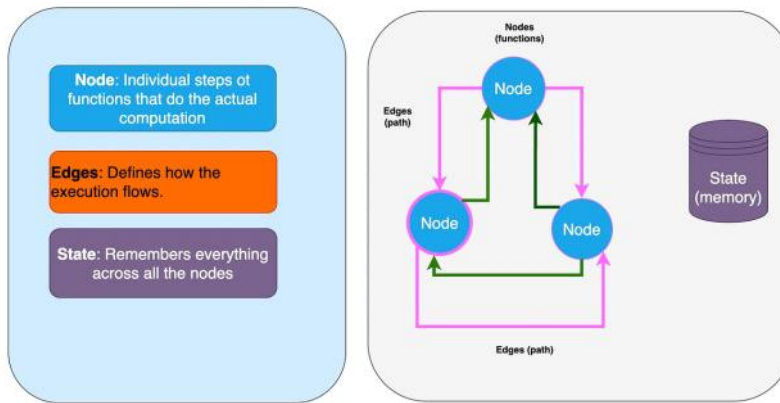

What is LangGraph?

LangGraph is a framework from the LangChain ecosystem for building stateful, multi-step and agentic AI applications.

Why we required it?

LangChain - Simple AI assistants, Memory based application, chaining (LCEL), Agentic Patterns (Tool Calling, ReAct Agents, Self-Ask Agents) its used for reasoning capacity additional added to LLM.

Using LangChain: LLM chains and LCEL we can create DAG - (Direct Acyclicity Graph) components working in single direction.

LangGraph: From simple AI assistant to create a complex agentic pattern we can create using DCG.

Reason: We have a low level access on agentic patterns to complex patterns, Multi-agent

State : Pass the message across the node
